Statistics: Mean 11.528; Variance 1.960; scale 5.882

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The retinas were obtained from a 55 year old Caucasian male and total cellular poly(A)+ RNA was extracted 6 hrs after their removal. The retina RNA was kindly provided by Roderick R. McInnes M.D. Ph.D. from the University of Toronto. Library constructed by Bento Soares and

Statistics: Mean 36.033; Variance 154.129; scale 0.234

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                           Claim 1; Fig 13A; 45pp; English.

A novel human orphan receptor (W14724) is related to the known oestrogen receptor ER-alpha, and has been designated ER-beta. It is an oestrogen receptor-related nuclear receptor. The ER-bēta amino acid sequence was deduced from a CDNA clone (T62843) isolated from a human testis CDNA library. Rat, human and mouse ER-beta (W14723-25) can be used to isolate molecules for use in the treatment of cardiovascular diseases, central nervous system diseases, osteoporosis, prostate or ovarian cancer or benign prostatic hyperplasia and to test environmental chemicals for oestrogenic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Human oestrogen receptor beta (ER-beta).

DNA encoding estrogen receptor - useful in screening assay to identify novel ligands or hormonal analogues Claim 4; Page 18-20; 45pp; English.

This sequence represents a novel oestrogen binding protein. The cD sequence which encodes this protein can be alternatively spliced resulting in the detection of additional transcripts (see T88413). This receptor is able to bind and be activated by estradiol, eston estriol, can be used in a screening assay for the identification o drugs e.g. novel ligands or hormonal analogues.

Sequence 477 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                      Dijkema

                                                       Claim 1; Fig 1; 45pp; English.

A novel rat orphan receptor (W14723) is related to the known oestrogen receptor Er-alpha, and has been designated ER-beta. It is an oestrogen receptor related nuclear receptor. The ER-be amino acid sequence was deduced from a cDNA clone (T62842) isola from a rat prostate cDNA library. Rat, human and mouse ER-beta (W14723-25) can be used to isolate molecules for use in the treatment of cardiovascular diseases, central nervous system diseases, osteoporosis, prostate or ovarian cancer or benign prostatic hyperplasia and to test environmental chemicals for

New isolated oestrogen r
                                                                                    disease
Claim 1;
A novel mouse orphan receptor (W14725) is related to oestrogen receptor ER-alpha, and has been designated It is an oestrogen receptor related nuclear receptor amino acid sequence was deduced from a course
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      W14725

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           molecules for use
                                               DNA encoding estrogen receptor - us identify novel ligands or hormonal Claim 4; page 20-22; 45pp; English.
                                                                                                                                                                      Homo
         This partial sequence represents a splice variant of a novel cestribinding protein, detected by screening a human testis cDNA library This protein contains an alternative exon 8 (exon 8B) of the novel cestrogen receptor represented. As a consequence of the introduction
                                                                                                                                                                                       0estrogen

This receptor is able to bind and be activated by estradiol, estone and estroil, can be used in a screening assay for the identification of new drugs e.g. novel ligands or hormonal analogues. This variant does not contain an AF-2 region and therefore probably lacks the ability to modulate transcription of target genes in a ligand dependent fashion.
                                                                                                    DNA encoding estrogen receptor - useful in screening assay to identify novel ligands or hormonal analogues Claim 4; Page 30-32; 45pp; English.

This sequence represents a splice variant of a novel oestrogen binding protein isolated from human thymus tissue. This protein contains an alternative exon 8 (exon 8C) of the novel oestrogen receptor represented in T88412. This novel receptor is able to bind and be activated by estradiol, estone and estriol, can be used in a screening assay for the identification of new drugs e.g. novel ligands or hormonal analogues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oestrogen receptor protein; estone; estriol; screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          W33214 standard;
W33214;
  This variant does not lacks the ability to m dependent fashion.

                                                                                                                                                                                                                                                                                                                          DNA encoding estrogen receptor - useful in screening assay to identify novel ligands or hormonal analogues Claim 4: Page 16-17; 45pp; English.

This sequence encodes the ligand binding domain of a novel constrogen binding protein, detected by screening a human testis cDNA library. This receptor is able to bind and be activated by estradiol, estone and estriol, can be used in a screening assay identification of new drugs e.g. novel ligands or hormonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human oestrogen receptor protein ligand binding cestrogen receptor protein; steroid; estradiol; cestradiol; ligand binding domain.

Disclosure; Fig. 1-1 - 1-2; 26pp; English.

Steroid receptor protein;

The protein is expressed in an expression system from cDNA operably

linked to control sequences compatible with eukaryotic host cells.

This method allows expression under conditions which favour appropriate
post-translational processing. It also produces large amts. of purified
protein useful in the design of agonist and antagonist cpds. for study
of the mechanism of action of the steroid binding proteins in general,
and for use in diagnostic assays for the proteins or antibodies to
them. These assays are important in, eg the diagnosis of tumour
sensitivities to steroid metabolism. Suitable host cells are VERO,

Hela and CHO cells.

The DNA can be used to make the hormone receptor proteins functional modified forms in quantities not previously possible. The receptor proteins can be used to screen cpds. for receptor-agonist receptor-antagonist activity. They can also be used in diagnostic a course of the contract of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprising glucocorticoid, mineral and novel hormone receptors Example; Fig III-2; 243pp; English

DNAs encoding hormone receptors and the hormone receptors themselves are claimed. The DNA can be used to make the hormone receptor proteins and functional modified forms in quantities not previously possible. The receptor proteins can be used to screen cpds. for receptor-agonist or receptor-antagonist activity. They can also be used in diagnostic assays. Also claimed is pure DNA encoding oestrogen-related receptors hERR1 and hERR2 and hERR2 and hERR2. The new hERR1 and hERR2 receptors will provide
                                                                                                          comprising gluccocriticald, mineralocorticald, thyroid hormone and novel hormone receptors

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the amino acid sequence of a mutant nuclear glucocorticoid receptor (NGR), especially mutated in the region encoding the ligand binding domain (LBD), such that the activity of the receptor is induced more strongly by a synthetic glucocorticoid ligand than by a natural glucocorticoid ligand. The mutation is a point mutation in the coding sequence (a transition mutation) generated by site-directed mutagenesis. This causes a replacement of the Ile residue at position 747 with a Thr residue. The position lies in the region between helices 11 and 12. The mutant coding sequence is used to generate a fusion protein comprising a protein whose activity is to be regulated by and fused to the NGR sequence. The protein is preferably a recombinase, especially the Cre recombinase from bacteriophage P1 (see V05702). The sequence encoding the fusion protein, and vectors containing it, are used to treat cells either ex vivo or in vitro for use in gene therapy. Vectors containing and expressing the protein allow the transfer of heterologous genes to the cells' genome by recombinase-directed recombination at loxp sites. By using a mutated LBD, normal physiological levels of the ligand within the ligand.

A fusion protein (W17789) comprises jellyfish green fluorescent protein (GFP) fused to rat glucocorticoid receptor (GR) via a Glycal repeat linker. The GFP moiety contains an S65T substn. and the GR has a C655S substn. that humanises the protein and increases contg. a number of steroid receptor response elements in array, is used to visualise directly the interaction of GR and its binding site in chromatin using the fluorescently labelled GR. This provides the direct opportunity to visualise receptor/target interactions and can be used to screen for ligands that activate
                                                                                                                                                                                                                                                                                         Query Match
